A corporate wellness program from Abercrombie Radiology

Healthier employees: Creating a culture of well-being.

Abercrombie Radiology

The power of prevention

Traditional medicine is designed to treat disease once it is diagnosed. Unfortunately, by the time symptoms appear, it can be too late.

There is a better way, and one that demonstrates a clear benefit to your most valuable assets—your employees. The Wellness Program at Abercrombie Radiology is designed to detect the early signs of diseases and chronic health conditions in a more complete and definitive way than they could likely achieve on their own.

With the power of early detection, disease can be treated more effectively. In some cases, it can be reversed. Early detection can change unhealthy behavior. And early detection can save lives.

When you offer a Wellness Program like ours to your people, they will truly understand just how much they are valued. What's more, your company cuts healthcare costs by avoiding chronic conditions and their associated care expenses, as well as lower overall medical claims and insurance premiums.

The key component

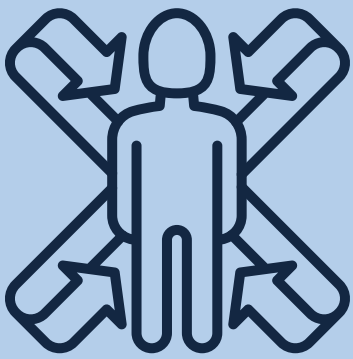
What's missing from a typical annual physical? For starters, visual evidence of good health. Silent conditions like early-stage cancers of the lungs, pancreas, and colon, aneurysms, hidden visceral fat and other chronic conditions will likely not be revealed with standard blood tests or by an external physical examination. Detecting these problems early is only possible with preventive imaging.

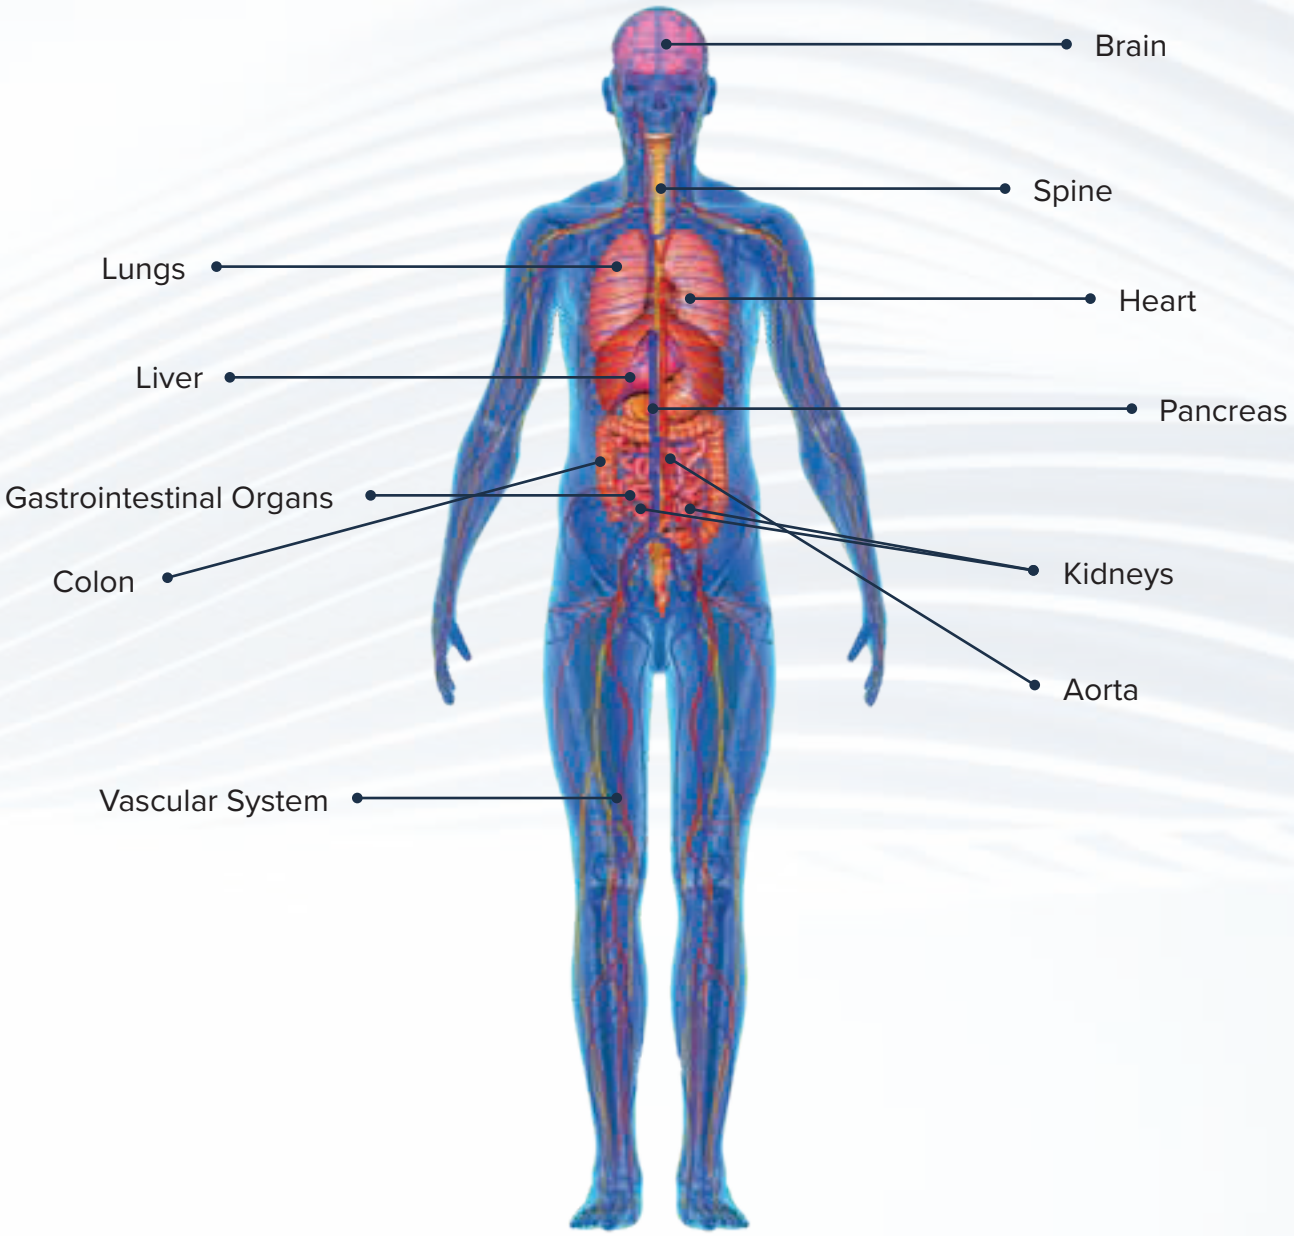
The Wellness Program at Abercrombie Radiology includes the most comprehensive visual anatomical assessment available—using full body MRI. This thorough evaluation of the inside of the body is performed without any ionizing radiation. The results are interpreted by a radiologist, a doctor specialized and experienced in diagnosing diseases and health conditions of the brain, vascular system and the internal organs within the chest, abdomen and pelvis.

The full body MRI, combined with a consultation with one of our radiologists, lets your employees know where they are at the greatest health risks so they can work with their doctors and other professionals to develop a sound plan to keep them healthy. For some, life-threatening diseases could be detected, affording them the option of more successful and less toxic treatment options.

Benefits of the full body MRI:

- Early detection. When health abnormalities are identified early, treatment outcomes are often improved.
- Radiation-free. Unlike CT scans, MRIs use magnetic fields and radio waves, which makes them a safer option for repeated scanning.
- Detailed, high-resolution images. MRI provides excellent visualization of soft tissues, muscles, ligaments and nerves, enabling our doctors to detect problems that could be missed with other medical tests.
- Comprehensive assessment. A single scan can assess many body systems that are not routinely assessed by conventional screening.





Cancer: Early detection increases the 5-year survival rate to nearly 90%

Brain Abnormalities: Detect neurological problems 2-3 years before symptoms appear

Aneurysms: Often treatable if detected before they rupture

Included: A consultation with our physician

After the test results are evaluated, our doctor will consult with your employee to review test results, answer questions and provide proactive recommendations to help them take the first steps needed to achieve control of their health.
